

Installation

Stable release

To install EthoPy, run this command in your terminal:

```
1 pip install testcore
```

This is the preferred method to install EthoPy, as it will always install the most recent stable release.

If you don't have [pip](#) installed, this [Python installation guide](#) can guide you through the process.

From sources

To install EthoPy from sources, run this command in your terminal:

```
1 pip install git+https://github.com/alexevag/testcore
```
